

Ecommerce Website Migration: Pre-Launch SEO Checklist

Migrating your current site to a new CMS or platform? Here is a handy SEO checklist specific to ecommerce sites.

Technical & On-Page Review

- Make sure your team lead/dev team hires a UX consultant/contractor. There is too much money on the line to "think" you know what your customers want from a design standpoint. This affects SEO and beyond.
- Implement meta noindex, nofollow tag on all pages to avoid crawling of pages
- Add Disallow: / to robots.txt file to block robots from crawling site
- Make sure rel next prev canonical tag is implemented on paginated pages (side note: yes Google deprecated this recently, but it is still recommended for other search engines)
- Review JavaScript handling: test as Googlebot to see if images, header tags, content appears
- Review all schema types and test with Google's rich snippet testing tool
- Review meta tags (via site crawl and testing with user agent Googlebot): title tags, h1 tags, meta descriptions; make sure you port over from old site to new site - DO NOT PERFORM KEYWORD RESEARCH AND CREATE NEW TAGS UNLESS IT'S A NEW PAGE.
- Review alt text implementation: run site crawl
- Get a list of any "junk" urls and query parameters to add to Google Search Console and robots.txt file
- Run a test order of Google Analytics, Tag Manager, Adobe, or whatever analytics platform you use to make sure data is being passed properly
- Make note of internal site search settings you need to adjust in analytics before launch
